Nationally, one in five children has a diagnosable mental health issue with only 10 to 40% accessing treatment. The Access Workgroup aims to create a system that will identify and provide appropriate and quality services to children, as early as possible, before challenges become more complex.

**Raising Awareness of Resources**

One of the biggest barriers preventing families from accessing help is not knowing about available services and supports. A Wisconsin Children and Youth with Special Health Care Needs Medical Home Systems Integration Project group worked to address this issue by identifying and integrating children’s mental health services into the Wisconsin First Step (WFS) database. The access workgroup distributed promotional material throughout child-serving systems. The workgroup is committed to identifying additional resources and promoting the WFS and Wisconsin 2-1-1 (another key resource line in Wisconsin) as ways for families and professionals to connect to needed services.

**Example of information provided by WFS**

*Number of providers of each type of service, by county (2017)*

**Access Workgroup Indicators**

The Access Workgroup will track success by using the following measurements:

- Availability of child, family, and school social workers
- Early childhood screening
- Insurance coverage for children

**System of Care for Children’s Social and Emotional Development**

The workgroup reviewed available services along the continuum of mental health services and supports, often called a “system of care.” Future activities will include identifying and promoting successful regional resources to communities across the state.

**Goal Statement**

Wisconsin’s children, youth, and families have timely access to high quality, trauma-informed, and culturally appropriate mental health services that promote children’s social and emotional development.

**Key Activities**

- Promote awareness of existing resources for families and providers.
- Assess service and support gaps.
- Identify ways to increase parent and youth involvement in policy and program development.
- Identify and implement best practices in increasing access to services.

Tipping the Scale
Wisconsin’s future success relies on the health and well-being of our children. To ensure new generations of productive, conscientious citizens, we must counter any negative experiences that cause toxic stress with protective factors.

The Office of Children’s Mental Health is using the metaphor of a scale\(^2\) to think of the course of a child’s development. A scale has two ways to tip the balance, the counterbalance and the fulcrum or balancing point. In the metaphor, the positive experiences or protective factors, are loaded on to one side of the scale while the challenges or risk factors are on the other side. If the scale is loaded with positive experiences (not all experiences hold the same weight) the scale tips in a positive direction. A person with a scale tipped toward the negative side has increased risk of negative health outcomes.

The Role of Genes
The second way to tip the scale is to move the fulcrum. Besides experiences, genes also play a role. In this metaphor the fulcrum represents the genetic inheritance of a person. Some people are born more susceptible to toxic stress and others are less effected. Research into epigenetics has found that the fulcrum is not permanently set. There are pivotal times in a child’s development when experiences can modify how genes are expressed. These times, such as the first five years of a child’s life, the passage to adolescence and the transition to adulthood, are critical periods where intervention has a greater impact on long-term well-being. Leveraging resources to enhance supports at these critical times is a wise investment in our children’s future.

The Community’s Role
A child’s community plays an important role. The network of community relationships, environments and opportunities all lay the groundwork for the next generation. Parents play key roles in a child’s life, and other adults can as well. An attentive child care provider, teacher, coach or neighbor can bolster a child’s resilience against toxic stress. We can change the trajectory of the next generation by increasing broad-based understanding in communities around the importance of a child’s social and emotional development, and bolstering resources for children and families.

Access in Action
Below are a few examples of Wisconsin activities underway to improve access to services and supports:

- School districts are better at identifying children’s needs and connecting them to providers. Recent Wisconsin legislation will make it possible to expand school-based mental health services.
- Mental health providers are supported with learning opportunities including training on Trauma-Focused Cognitive Behavioral Therapy, Parent Child Interaction therapy and Child Parent Psychotherapy.
- Students are developing stigma reduction campaigns and peer support groups in their schools.
- Adults across the state are being trained in Youth Mental Health Frist Aid to help adolescents who are experiencing a mental health or addictions challenge.
- The Child Psychiatry Consultation Program is available in areas of the state to assist primary care clinicians in delivering better informed mental health care.
